

Muon and Tracker Alignment at Start-Up

Jim Pivarski

Texas A&M University

8 December, 2009

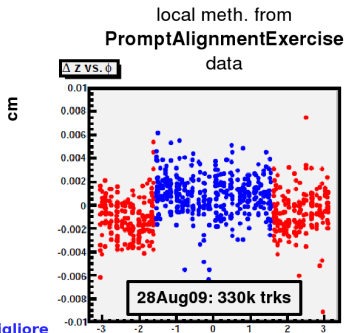

- ▶ Tracker alignment
 - ▶ CRAFT-09: repeated CRAFT-08 exercise, introduced prompt workflow (frequent, automated, low-statistics alignment)
 - ▶ Cooling incident: physically moved pixel half-shell 30 μm in z
 - ▶ Re-aligned using November cosmic rays, [this is startup](#)
- ▶ DT alignment
 - ▶ CRAFT-09: repeated CRAFT-08 exercise with tighter bounds on alignment uncertainties, [this is startup](#)
 - ▶ Barrel hardware alignment is now producing alignments; testing with tracks
- ▶ CSC alignment
 - ▶ CRAFT-09: corrected few-mm disk position errors with tracks, hardware system providing missing degrees of freedom, [this is startup](#)
 - ▶ New LHC runs provide too few beam-halo tracks for alignment

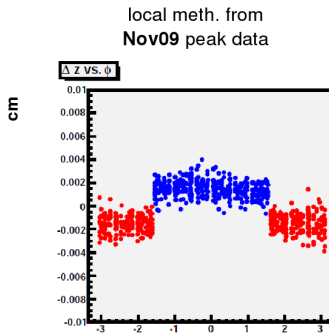

- ▶ Below: module position differences before and after cooling incident
- ▶ Left: “after” = prompt alignment performed immediately after incident (low statistics, but pinpoints the motion in time)
- ▶ Right: “after” = full-statistics November cosmic ray alignment

BPIX after TIB cooling accident: wrt Aug09pk_r1

E. Migliore

- ▶ Month-long CRAFT: ~ 3 million tracks after quality cuts
- ▶ November cosmics ([startup](#)): ~ 2 million
 - ▶ roughly the same quality in strip tracker
 - ▶ pixel (smaller target for cosmic rays): $2\text{--}2.5\ \mu\text{m}$ (nearly ideal) in CRAFT but $3\text{--}4\ \mu\text{m}$ in startup alignment
(RMS of distribution of median of residuals, measure of local precision)
- ▶ About 10 M quality minbias tracks needed to improve alignment

Tracker alignment systematics

- ▶ Combining data with different topologies (minbias, cosmics) and introducing new constraints (primary vertex, resonances) yields qualitatively new information on the global shape of the tracker

- ▶ 5 mm gap between two half-cylinders of TIB (known since first alignments at the Tracker Integration Facility)
- ▶ Want to see if tracks from collisions confirm the observation

- Compare the “real” (from combined meth.) to the design geometry

- TIB: 5 mm shift of the two HalfBarrels along z-axis (two halves shifted apart)
- confirmed by optical survey
- remaining scatter: indication of “skew”?

E. Migliore Univ.Torino/INFN

- ▶ Minbias illuminate the tracker endcaps better than cosmics
 - ▶ the last TEC disk is used to connect tracker to muon hardware alignment system
 - ▶ improved tracker endcap → improved hardware alignment global position

Studying tracker with muon hits

Jim Pivarski

6/18

- ▶ As an external detector, the muon system can analyze global distortions in the tracker
- ▶ Select one DT layer to simplify and minimize dependence on muon alignment
- ▶ Varying DT layer position maps a family of curves for tracker momentum error ($\Delta p_T/p_T$)

- ▶ More details in the Alignment & Calibration meeting today

DT startup from CRAFT-09

Jim Pivarski 7/18

Repeated all checks developed for CRAFT-08

- ▶ Right: lots of plots
- ▶ Below: local segment cross-check
 - ▶ now includes full propagation between stations (not linear)
 - ▶ 0.70 mm upper bound on local alignment error \rightarrow 0.35 mm for stations 1–3

wheel +0, station 1

Cosmic splitting results

Jim Pivarski 8/18

J. Tucker

- ▶ DT alignment yields clear improvement in standAloneMuons (left) and globalMuons (right), with little difference between globalMuon and FirstMuonStation (4.2% vs. 4.0% at 200 GeV)
- ▶ standAloneMuon resolution is still valid
- ▶ muon alignment may need to be repeated to regain globalMuon resolution

Barrel hardware alignment

Jim Pivarski 9/18

- Differences in chamber positions between hardware and track-based geometries
- Top-left: reconstruction was following some LED reflections
- Bottom-left: corrected

Barrel hardware alignment

Jim Pivarski 10/18

- Differences in chamber positions between hardware and track-based geometries
- Sine curve: global position with respect to tracker

- $x \rightarrow 1.2$ mm
- $y \rightarrow 4.5$ mm
- $\phi_z \rightarrow 0.58$ mrad

- ▶ Largest correction: positions of disks after closing
- ▶ Important step after beam-halo alignment, to locate internally-aligned rings with respect to tracker

ME-1/2 before ring alignment

ME-1/2 after ring alignment

Endcap hardware alignment

Jim Pivarski 12/18

- ▶ Hardware geometry provides z and ϕ_x (tracks are insensitive to these)
- ▶ Reconstruction recently extended to transfer lines (inter-disk) and $r\phi$ positions of monitored chambers
- ▶ Opportunity to compare $r\phi$ with tracks

Laser line residuals: internal consistency of hardware alignment

Himali Kalakhety

Beam-halo! But not many...

Jim Pivarski 13/18

Total CSC Rate vs Time

- ▶ Longest period of true beam-halo: 13 min in run 122294
- ▶ Overlaps track yield: 229 in outer ring after sensible cuts
- ▶ Not enough for alignment

New beam-halo residuals

Jim Pivarski 14/18

- Two types of residuals: continuity ($\Delta r\phi$) and differentiability ($\Delta\frac{d(r\phi)}{dz}$)
- Outer ring consistent with ~ 1 mm RMS misalignment

Very soon (this year?)

- ▶ Tracker: combine cosmics and minbias with primary vertex constraint, beam-halo
- ▶ DT: continue aligning with cosmic rays
- ▶ CSC: align chambers relative to ring with beam-halo, rings relative to tracker with cosmics

Larger datasets ($\sim 5 \text{ pb}^{-1}$)

- ▶ Tracker: add isolated muon, J/ψ , Υ
- ▶ DT: combine cosmics and collisions muons
- ▶ CSC: use collisions for chambers-in-ring and tracker-to-ring (cross-checks)

Even larger

- ▶ DT and CSC together, using standard algorithm

- ▶ Aysen Tatarinov (TAMU), new muon alignment expert in training
- ▶ Studied alignment resolution as a function of integrated luminosity using standard algorithm
 - ▶ aligning all chambers with more than 30 tracks
 - ▶ RMS $r\phi$ resolution *for the aligned chambers*
 - ▶ see backup for full results

- 5 pb^{-1}

- ▶ Tracker CRAFT alignment is precise, but cooling incident moved things; current alignment is post-incident
 - ▶ new project: analyzing tracker global distortions with the muon system; if you're interested, more details in Alignment & Calibration meeting
- ▶ Current DT + CSC alignments based on CRAFT-09
- ▶ Hardware geometry is being studied with tracks (right now for barrel and soon for endcap)
- ▶ Too few beam-halo muons for alignment, but the tracks we do see have the right distributions
- ▶ Aysen: new aligner in the group, quantifying resolution with low-lumi samples
